

The end of the
digestive tract where
feces (poo) leaves
the body

A sac that holds the
urine (pee) made by
the kidneys

The operation to
remove the foreskin
of the penis

Discharge or release
of semen from the
penis

A coiled tube at the
back of the testicles
that holds sperm

When the penis fills
with blood and
becomes hard

The extra skin at the
tip of the penis

The tube-like sex
organ located outside
of the body

The gland near the
bladder that adds
fluid to sperm

Sac that holds the
testicles

A combination of
sperm and fluid. This
is what leaves the
penis during
ejaculation

Two small glands
that make fluid that
gives sperm energy
to help them move

The reproductive life-
giving cell for a
person with a penis

Glands that make
sperm and the
hormone
testosterone

Urine (pee) and
semen move through
this tube to the
outside of the body

Two narrow tubes
that carry sperm from
the testicles to the
urethra
